#### ***Trial Summary:***

This clinical trial was done to study a new medicine called, “GDC-8264”, for the treatment of patients with “inflammatory bowel disease” or “IBD”. This study was done to find out how safe was it for healthy people to get GDC-8264, and how well GDC-8264 was tolerated. Investigators also wanted to find out the effect of food on GDC-8264, and the effect of GDC-8264 on other medicines (drug-drug interaction). Sixty-eight healthy people took part in this study at one study center in one country.

Healthy volunteers for single ascending dose (SAD;  $n=38$ ), multiple ascending dose (MAD;  $n=15$ ), and drug-drug interaction (DDI;  $n=15$ ) cohorts were enrolled at one study site in the Netherlands to evaluate the safety and tolerability of GDC-8264, with potential activity in patients with inflammatory bowel disease (IBD). All 68 healthy volunteers completed the study and comprised the safety-evaluable population. Results showed single and multiple doses of GDC-8264 taken by mouth were safe and well-tolerated. GDC-8264 can be taken with or without food. One type of measurement indicated DDI, while other measurements did not. There were no deaths or serious adverse events. No single study can tell us everything about the risks and benefits of a medicine. It takes lots of people in
