

Breast Cancer

A study to compare the study medicine (GDC-0810) to another treatment (fulvestrant) in patients with breast cancer

A Study of GDC-0810 Versus Fulvestrant in Postmenopausal Women With Advanced or Metastatic Breast Cancer Resistant to Aromatase Inhibitor (AI) Therapy

Trial Status
Terminated

Trial Runs In
6 Countries

Trial Identifier
NCT02569801 2015-000106-19
GO29689

The source of the below information is the publicly available website [ClinicalTrials.gov](https://clinicaltrials.gov). It has been summarised and edited into simpler language.

Trial Summary:

The primary purpose of this study is to evaluate the efficacy, safety, and tolerability of GDC-0810 compared with fulvestrant in postmenopausal women with advanced or metastatic estrogen receptor positive (ER+)/ human epidermal growth factor receptor 2 negative (HER2-) breast cancer resistant to AI therapy. The development of GDC-0810 has been halted by the Sponsor and the enrollment in this study has been discontinued. Participants currently enrolled in the study who are experiencing clinical benefit may continue receiving GDC-0810 as a single agent or fulvestrant until disease progression (PD), unmanageable toxicity, withdrawal of consent, exhaustion of GDC-0810 drug supply, or termination of the study by the Sponsor.

Gender
Female

Age
≥18 Years

Healthy Volunteers
No

This clinical trial was done to study a new medicine called, "GDC-0810". Researchers wanted to find out how effective GDC-0810 was for patients with ER+/HER2- breast cancer, in comparison to an approved treatment (fulvestrant). Seventy-one patients took part in this study at 26 study centers in 6 countries.
