A Study to Compare Pharmacokinetics (PK) of Etrolizumab Administered Subcutaneously by a Prefilled Syringe With Needle Safety Device (PFS-NSD) or an Auto-injector (AI)

Trial Status
Completed

Trial Runs In
1 Countries

Trial Identifier
NCT02996019 GX29504

The source of the below information is the publicly available website [ClinicalTrials.gov](https://clinicaltrials.gov). It has been summarised and edited into simpler language.

Trial Summary:

This is a randomized, 2-part, 2-arm, open-label, parallel-group, multi-center study to compare the PK of etrolizumab administered subcutaneously by an AI (test device) or a PFS-NSD (reference device) in healthy participants. The study will comprise a pilot cohort (Part 1) to estimate the geometric mean ratio (GMR) and variability of the maximum observed concentration (C_{max}) and area under the concentration-time curve (AUC) to confirm or determine the sample size for the pivotal cohort (Part 2). The pivotal cohort will demonstrate exposure comparability of C_{max}, AUC from Hour 0 to the last measurable concentration (AUC_{last}), and AUC from Hour 0 to extrapolated infinite time (AUC_{0-inf}), values for a single dose of etrolizumab administered subcutaneously either by the AI or the PFS-NSD.
